

ABSTRACT

Provided is a method making it possible to
measure the molecular weight useful for the
specification of a substance bonded on a substrate by
5 MALDI-TOF MS. When the substance is to be bonded on
the substrate, MALDI-TOF MS analysis can be utilized
by providing a partial structure to be disconnected
by light in the bonded portion and selectively
disconnecting the partial structure by light having a
10 predetermined wavelength to bring the substance in an
unfixed state.
